

Case Study 1: Successful Site Identification

CHALLENGE: A sponsor was in the process of site selection for a Phase 3 randomized study in pediatric patients with Multiple Sclerosis followed by an open-label extension. Through sponsor site outreach, the sponsor study team had identified 7 sites interested in participation but needed help identifying up to 10 additional US pediatric sites

APPROACH: Using an early engagement survey of its sites, including those that had previously declined or not responded to the sponsor, I-ACT for Children leveraged its site network and site champion relationships to facilitate CDA, completion of a feasibility survey and ultimately contracting.

OUTCOME:

16 interested and qualified sites were identified within 2 weeks.
